

## AI Use Declaration - Lab 03

I used Claude (Anthropic's AI assistant) throughout this lab in the following ways:

- Guidance on Colab workflow: I asked Claude to explain how to add cells, run them in order, and follow the lab's predict-before-measure rule, consistent with Labs 01 and 02.
- Drafting predictions: For each  prediction cell in Parts 1-3, I discussed my reasoning with Claude (based on reading the corpus articles myself first) and asked for help phrasing my predictions clearly, before running each cell that revealed the actual result.
- Interpreting results: After each cell ran, I asked Claude to help me understand the retrieval scores, the near-ties between chunks, and why the paraphrase queries performed worse than the literal ones.
- Extension tasks: For the three Core extension tasks, I asked Claude to help me write the Python code to answer each task's "Do" instruction, based on the exact specification in the lab's README. I ran all the code myself in Colab and verified the outputs against the "Expect" values given in the README before writing my own reflection answers. I did not complete the Advanced tasks (4-5), as they required a separate corpus file I could not locate.

I did not use AI to generate model outputs or make claims I did not verify by executing the code myself. All numeric results (chunk counts, retrieval scores, generated answers) come from my own executed cells in Colab. All written predictions and reflections are in my own words, based on my understanding of the executed output.
